

Zim8.2

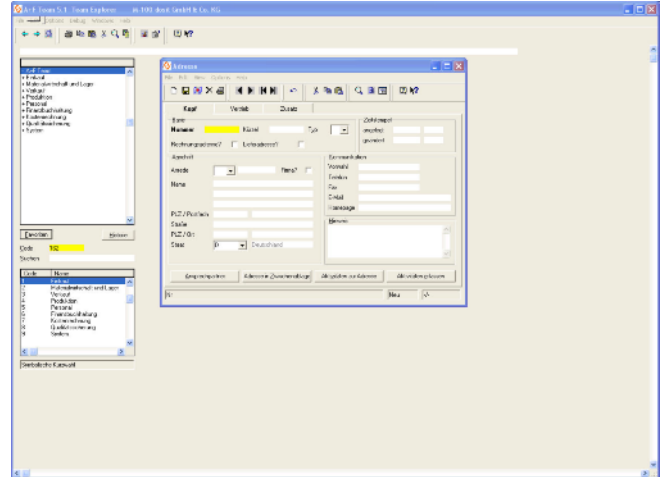

ZIM 8 – Why Upgrade? Complex Applications. Simple Solution

Why Upgrade to Zim 8?

ZIM is committed to ensuring the ongoing success of your Zim based applications and database systems. With Zim 8, we have made significant improvements in how data is processed and stored. Our new ZIM Thin Client and 'Always On' Zim Server have enabled significant improvements in speed and power as well as eliminated many deadlock and multiple user issues.

ZIM 8 Benefits:

- **True Client/Server Applications**
- **Increased productivity with multiple users**
- **Improved data integrity**
- **Reduced maintenance cost**

Key reasons why all Zim users would greatly benefit from an upgrade to Zim 8:

Thin Client

Advanced Lock and Data Management

- By integrating lock management into Zim Server, Zim 8 prioritizes and serializes lock requests and dramatically decreases deadlocks.
- Zim Server also centrally controls all transactions through the Data Manager and enables multiple users to simultaneously work on processes without having to wait for database updates.

Automated Back up

- Zim 8's Online Back up automatically generates a mirror database which minimizes system downtime and dramatically improves database integrity and recovery.
- Online Back up also enables users to switch over to the mirror database when required and continue their work without interruption.

Expanded Administrator Control

- Zim 8 administrators can now monitor shared memory operations in real time, allowing them to quickly identify issues or suspend the database during application changes.
- All transactions are exclusively and centrally controlled by the Data Manager and are more easily monitored and controlled by the administrator.

Zim Server dramatically improves performance when there are multiple users and also handles multiple databases, thus reducing processing and resource requirements.

Zim Server enables the Lock Manager and On Line Backup to be scheduled for automatic starts, reducing the need for administrator support.

Decreased Resource Requirements

- Zim Server dramatically improves performance when there are multiple users and also handles multiple databases, thus reducing processing and resource requirements.

Zim Server enables the Lock Manager and On Line Backup to be scheduled for automatic starts, reducing the need for administrator support.
